

Car Warranty Ecosystem – Ajay Alamuri, Meredith Molyneux, Nicholas Woodward

[GitHub Repository Link](#)

Problem Statement:

Car owners struggle to keep track of the swaths of information that vehicles have. This results in confusion and frustration when lining up service appointments, warranty claims, and other vehicle history, especially when trying to trade in your vehicle. This can lead to further legal headaches down the road as especially aged owners may forget about incidents that may have affected the car's value.

Proposed Solution:

Our proposed application bridges vehicle production, transportation, inspections, and servicing all together, allowing for a centralized dashboard of vehicle details. Since manufacturing, warehousing and shipping, and dealerships all exist spanning different national borders, bridging the information together with networks enables users to map vehicle details across all stages of production and maintenance.
